This is one of 2,122 random reads from the M13 library. For annotation of identified clones (BLASTX, BLASTN and mapping to E. coli K12 genome) please see ffrench-Constant et al. 2000, Nucleic Acids Res.

Seq primer: M13 Forward
Class: shotgun.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.

Claim 3; Page 14; 24pp; German.

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in sometic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences

Rat cryptdin-1, -2, and -3 genes (see also T30736 and T30738) were isolated from a Sprague-Dawley genomic library cloned in EMBL3. The cryptdin-2 gene, or corresponding cDNA (see also T30734), can be used to produce large amounts of cryptdin-2 for use in treating inflammatory pathologies of the intestine

(A) are used, specifically in Beta vulgaris, to control expression of transgenes, particularly to alter carbohydrate metabolism; reduce loss of storage substances; express invertage inhibitor, fructosyl transferase, levan sucrase or genes that encode inhibitor, fructosyl transferase, levan sucrase or genes that encode or transporter proteins for nitrogen compounds, or increase resistance to, or tolerance of, pathogens. (A) provide tissue-specific transgene expression, either in roots or above-ground parts, so avoid pleiotropic effects, e.g. when expressing invertase inhibitor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This DNA fragment obtainable from Arabidopsis thaliana is capable of promoting rook knot and cyst nematode-inducible transcription of an associated DNA sequence when reintroduced into a plant. The promoterless GUS construct binary vector pWGG553 was mobilised by triparental mating to Agrobacterium tumefaciens WGG101 and the resulting strain was used for Arabidopsis root transformation. Line pWGG553#25 was identified as a line which showed strong GUS expression inside syncytia and giant cells induced by the cyst nematode Heterodera schachtii and the root knot commenced Meloidogyne incognita, respectively. Promoter tags from line pWG553#25 were sequenced. The claimed DNA fragment is nematode feeding site-specific. Also claimed are: (1) a portion or variant of the above crapable of promoting root knot and cyst nematode inducible transcription of an associated DNA sequence when reintroduced into a control, and which causes the production of a plant cell-disruptional control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production of a plant cell-disruption control, and which causes the production comprising the chimeric DNA sequence compalition site; (4) a microorganism containing the replicon of (3); (5)

a plant cell having incorporated into its genome the chimeric DNA of (2); (6) a root system of a plant consisting of the cells of (5); (7) a plant consisting of the cells of (5); (7) a plant consisting of the cells of (5); (8); a plant, especially a potato plant; (8) a plant grafted onto the root system of (6); (9) a part of a plant; selected from seeds, flowers, tubers, roots, leaves, fruits, pollen and wood, obtained from the plant of (7) or (8), and (10) a crop consisting of the plants of (7) or (8). The DNA fragment can be used to identify subtragments capable of promoting transcription of an associated DNA sequence in a plant. It can also be used for making hybrid regulatory DNA sequences. The chimeric DNA sequence of (2) can be used for transforming plants (all claimed). The DNA sequence can be used to reduce the susceptibility of a plant to parasitic nematodes. (Updated on 17-OCT-2003 to standardise OS field)

6). The invention provides sequences shown in AAW63160 to AAW6169 that are inhibitors of mMCP-6. These peptides which are tryptase-6 complex inhibitors, can be used for treating a mast cell-mediated inflammatory disorder. The inhibitors can be used to treat inflammatory disorders including asthma, allergic rhinitis, uriticaria and anticedema, eczematous dematitis, (atopic dermatitis), hyperproliferative skin disease, anaphylaxis, peptic ulcers, inflammatory bowel disorder, hyperresponsiveness and inflammatory skin conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 374 CIGCITITITATACTAAGTIGGCATTATAAAAAGCATIGCTIATCAAITIGTIGCAACG 433

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This nucleotide sequence includes a coding region for mouse mast cell procease 6 (mMCP-6, see AAW64242). The invention provides: compositions comprising an isolated tryptase-7 (such as mMCP-7, see AAW64233); a method for treating a blood clot by administering a nucleic acid molecule that codes for a tryptase-7, or an expression product; a nucleic acid encoding a serine procease (SP); and a method of producing a mature SP. Tryptase-7 polypeptides can be used for treating disorders mediated by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence was used in the preparation of an improved Bacillus amyloliquefactens barstar, i.e. barnase inhibitor, which can be used to restore fertility to male-sterile lines. The DNA sequence encoding the improved barstar, leads to increased barstar production in tapetum cells, due to improved translation, and possibly protein stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 CTGCTTTTTTATACTAGTTGGCATTATAAAAAGCATTGCTTATCAATTTGTTGCAACG 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          amyloliquefacions barstar, i.e. barnase inhibitor, which can be used to restore fettility to male-seraile lines. The DNA sequence encoding the improved barstar, leads to increased barstar production in tapetum cells, due to improved translation, and possibly protein stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

DNA in a enkaryotic cell, comprising introducing two DNA sequences (I, into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences
                                                                           Sequence-specific recombination of DNA in eukaryotes, useful particulariy for somatic cell gene therapy, uses an integrase to effect recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Site-specific integration of DNA into plastid DNA, useful for making transgenic plants used e.g. as food, by recombinase-mediated insertion.
                                                                                                                                                                                                       This invention describes a novel sequence-specific recombination (SSR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 CTGCTTTTTTATACTAAGTTGGCATTATAAAAAAGCATTGCTTATCAATTTGTTGCAACG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAQ50309-26 are probes which were used on a chip for capturing a number of target polynucleotides. A group of these probes may be attached on cells which form part of a single chip. The oligonucleotides to be detected are labelled and are complementary to the set of capture probes used. The detection chip may be used to detect a number of different polynucleotides concurrently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CAGCTTTTTTATACTAAGTTGGCATTATAAAAAGCATTGCTTATCAATTTGTTGCAACG 102

one or several att sites, where an att site is heterologus to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described. (1) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (1) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid molecule into a platform artificial artificial chromosome, preferably an ACes. (II) is useful for producing a

                                                                            cell, preferably a stem cell or an embryo. (II) comprises a heterologous mucleic acid that encodes a therapeutic product which is useful for making a library of Aces comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                   156 CAGCITITITATACTAAGTIGGCATTATAAAAAGCATIGCTTATCAATTIGTIGCAACG 215
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, tRNA, tRNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and
                                                                                                                                                                                                                                                                                                                             1 CTGCTTTTTTATACTAAGTTGGCATTATAAAAAGCATTGCTTATCAATTTGTTGCAACG 60
transgenic animal (e.g. a fish, insect, reptile, amphibian, arachmid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinfection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic

biopharmaceutical proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (RAC). This polymucleotide sequence represents an oligo relating to the method for producing plant artificial chromosomes of the invention

The sequences given in ABQ80304-05 are primers which were used to amplify DNA for use in the material of the invention. The primers amplify a 1377 DNA for use in the material of the invention. The print of a plasmid. The amplified is sequence (ABQ80306) was attached to the printer material of the invention of sequence (ABQ80306) was attached to the printer material of the invention which comprises at least one support having at least one oligomer and/or comprises at least one support having at least one oligomer and/or synthesising DNA where the product of amplification and/or ligation is constantation of nucleotide insertion/deletion, single nucleotide confidence of determination of nucleotide insertion/deletion, or SNP analysis.

Colymportide or protein expression. The printed material is useful in cresearch applications, or for providing scientists with oligomer and/or polymers from the printed materials easily and immediately. From the colymport of activities and/or polymer can be obtained immediately and directly, without need to make a request for it. The oligomers and/or polymers can be delivered and stored easily with reduced the facilities while eliminating the need to use special equipment or facilities may be anywork of a mick, efficient and the material is a mick, efficient and

by flanking the transgene with a bacteriophage lambda attachment P (attP) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic

plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide an antibiotic resistance. The present sequence is the attp coding region

The present invention describes a method of removing a transgene marker

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 69, P

Sequence 1, Application US/09308090

Patent No. 6395963

GENERAL INFORMATION:
APPLICANT: Oll, Stephan
APPLICANT: Van Der Lee, Frederique
APPLICANT: Sijmons, Peter
APPLICANT: Sijmons, Peter
TITLE OF INVENTION Nematode-Inducible Regulatory DNA Sequences
FILE REFERENCE: NG 57680
CURRENT APPLICATION NUMBER: US/09/308,090
CURRENT APPLICATION NUMBER: PCT/EP97/06472
ERALIER FILING DATE: 1999-05-14
ERALIER FILING DATE: 1996-11-18
ERALIER FILING DATE: 1996-11-18
ERALIER FILING DATE: 1996-11-18
ERALIER PLING DATE: 1996-11-18
ERALIER NEW SEQ ID NOS: 10
SOFTWARE: PATENTIN Ver. 2.0
ERQ ID NO 1
ELMOSTH: 3484
ELMOSTH: NAMBER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 102; DB 4; Length 2408; 100.0%; Pred. WPI; 2001-246016/26. 다. (DROE/) DROEGE Droege P;

Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.

Claim 3; Page 14; 24pp; German.

This invention describes a novel sequence-specific recombination (SSR) of DNA in a enkaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) ector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy its derivatives. The archod is particularly used in somatic gene therapy transfer to animals, but can be applied more generally for gene therapy transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences
                                                                       09
                                                                                            09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.
                                                                                                                                                                                                                                                                                                                          Sequence-specific recombination; SSR; integrase; gene therapy; somatic; targeted integration; attP; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for the site-specific integration of a DNA sequence into the plastid DNA of a plant or its derived cells. Transgenic plants in which a DNA sequence has been integrated, also their cell cultures, organs, tissues etc. are useful in human or animal nutrition, to produce seeds, and to produce pharmaceuticals or fine chemicals, e.g. enzymes, vitamins, amino acids, flavourings and aromatizing agents, dyes, antibodies and vaccines. The present sequence is a recognition sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TITIACAGIAITAIGIAGICIGITITITIAIGCAAAAICIAAITITAAIATATIGAIATITA 125

core or several att sites, where an att site is heterologous to the corrownsome, and permits site-directed integration in the presence of larwockesion system (ACes) (II) comprising several sites that participate carporation system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination, and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACE of molecule into an apation of artificial chromosome, preferably an ACE of molecule into an apation of transgenic animal (e.g. a fish, insect, reptile, amphibian, arachinid, or manumal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for comprising a library of ACes comprising random portions of a genome. ACC44612 committing a library of the program is necessarily and microcal in the accompanion of the comprising random portions of a genome and the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of t

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes. The methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC comprises a heterologous incloid acid encoding a gene product or as enzymes, antisense RNA, tRNA, rDNA, structural proteins, marker proteins, lagands, receptors, ribozymes, therapeutic proteins, marker proteins, lagends, receptors, shipozymes, therapeutic proteins, and biopharmaceutical proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistence to diseases, insects, herbicides, or stress in a plant. The heterologous mucleic acid optionally encodes a product that alters agronomically important trait in the plant, e.g. a product that alters untrained use and/or improves the nutrient quality of the plant. The heterologous mucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (MAC). This product method for producing artificial chromosome (MAC). This producing artificial chromosome (PAC) artificial chromosome of the method for producing artificial chromosome of the method for producing artificial chromosome of the method for producing artificial chromosome of the method for producing and producing and producing of the plant of the method for producing and producing of the plant of the method for producing and produce represents an oligo relating to the method for producing and producing of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant of the plant 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    blood factor, herbicide, stress, agronomical, nutrient quality;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method of removing a transgene marker by flanking the transgene with a bacteriophage lambda attachment P (attP) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antibiotic resistance. The present sequence is the attP coding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     198

The sequences given in ABQ80304-05 are primers which were used to amplify DNA for use in the material of the invention. The primers amplify a 1377 bp portion of lambda page DNA contained in a plasmid The amplified c sequence (ABQ80306) was attached to the printer material of the invention which comprises at least one support having at least one oligomer and/or colline applied on it. The printed material is useful in a method for synthesising DNA where the product of amplification and/or ligation is containation of nucleotide insertion/deletion, single nucleotide colline insertion/deletion, single nucleotide colline insertion/deletion, or SNP analysis.

CC cDNA and/or full-length cDNA which is recovered and used for determination of nucleotide insertion/deletion, or SNP analysis.

CC optionally, the cDNA and/or full-length cDNA is useful for the peptide, polymeptide or protein expression. The printed material is useful in crossarch applications, or for providing scientists with oligomer and/or polymers from the printed materials easily and immediately. From the printed materials easily and immediately and directly, without need to make a request for it. The oligomers and/or polymers and/or polymers and/or polymers and or printed material is a quick, efficient and labour and time while eliminating the need to use special equipment or inexpensive sample delivery system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           867

This sequence represents rat neuronal immediate early gene (IEG) cDNA clone R280. An IEG is a gene whose expression is rapidly increased immediately following a stimulus e.g., neuronal stimulation. Such neuronal IEGs have been found to encode a variety of proteins, including transcription factors, cytoskeletal proteins, growth factors and metabolic enzymes, as well as proteins involved in signal transduction. The identification of neuronal IEGs and the proteins they encode may provide important information about the function of neurons in, for example, learning, memory, synaptic transmission, tolerance and neuronal pasticity. Neuronal IEGs and antibodies against neuronal IEG proteins can be used to treat an animal with a deficiency in neuronal IEG proteins can be used to treat an animal with a deficiency in neuronal IEG responsivity deficiency may be a reduced or elevated level of expression of an IEC. The neuronal stimulus comprises a maximal electroconvulsive seizure and its effects influence learning or memory. The IEGs and protein products are useful in identifying compounds that modulate the expression or activity of IEG nucleic acids or proteins, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel genes and polypeptides, useful for treating conditions related to a deficiency in nIEG responsiveness to a stimulus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           431 rererracaggicaeraanaceareraagragingaricaragigacigeanargriere 372

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method for storing and/or delivering an oligomer and/or polymer applied on support. The support has oligomer and/or polymer applied on it, and is in the form of loose-leaf sheet or a card. The support is useful for storing and/or delivering an oligomer and/or polymer applied on it. The present sequence is Bacteriophage lambda DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate con recombinase catalysed recombination, and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for citroducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection, cransgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or marmal) by introducing (II) by cell fusion, lipid-mediated transfection, croprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 co ACC44732 and ABP95650 to ABP96657 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4189

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous introducing the PAC into a plant cell. Souch as enzymes, antisense RNA, tRNA, rDNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and proteins, ligands, receptors, ribozymes, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (MAC). This

The polypeptide monomers are variants based on a consensus sequence derived from the fibre forming regions of spider dragline protein, esp. the natural contein and the pattern of variation among individual repeats of DPI were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. DP-1A consensus sequence which comprises four repeats which differ from the consensus sequence given in AAW06201, according to the pattern (1) (5): (1) the poly-alanine sequence is a langual and processed in a conting of the pattern (1) (5): (1) the poly-alanine sequence is a langual and processed in the pattern (1) (5): (1) the poly-alanine sequence is a langual and processed in the pattern (1) (5): (1) the poly-alanine sequence is a langual and processed in the pattern (2) when the entire poly-
